

Who evaluates evaluators?

**Assessing cryptography evaluators assessing a
secure messaging application security**

Marion VIDEAU

Workshop on Randomness and Arithmetics for Cryptographic Hardware, WRACH 2023

Overview

- ▶ General considerations about security and cryptography a.k.a. old people rambles
- ▶ Small recap on ANSSI/CCN and ITSEF (CESTI) and security evaluations
- ▶ Secure messaging security challenges
- ▶ The example app under cryptographic evaluation: a modified matrix/element a.k.a. CRY.ME
- ▶ Evaluation on Quarkslab's side
- ▶ Conclusion

Our everyday challenge

$$\mathbf{a}_L \in \{0,1\}^n \text{ s.t. } \langle \mathbf{a}_L, \mathbf{2}^n \rangle = v$$

$$\mathbf{a}_R = \mathbf{a}_L - \mathbf{1}^n$$

$$\in \mathbb{Z}_p^n$$

(36)

$$\alpha \xleftarrow{\$} \mathbb{Z}_p$$

(37)

$$A = h^\alpha \mathbf{g}^{\mathbf{a}_L} \mathbf{h}^{\mathbf{a}_R}$$

$$\in \mathbb{G}$$

(38)

(39)

$$\mathbf{s}_L, \mathbf{s}_R \xleftarrow{\$} \mathbb{Z}_p^n$$

(40)

$$\rho \xleftarrow{\$} \mathbb{Z}_p$$

(41)

$$S = h^\rho \mathbf{g}^{\mathbf{s}_L} \mathbf{h}^{\mathbf{s}_R}$$

$$\in \mathbb{G}$$

(42)

$$\mathcal{P} \rightarrow \mathcal{V} : A, S$$

(43)

$$\mathcal{V} : y, z \xleftarrow{\$} \mathbb{Z}_p^*$$

(44)

$$\mathcal{V} \rightarrow \mathcal{P} : y, z$$

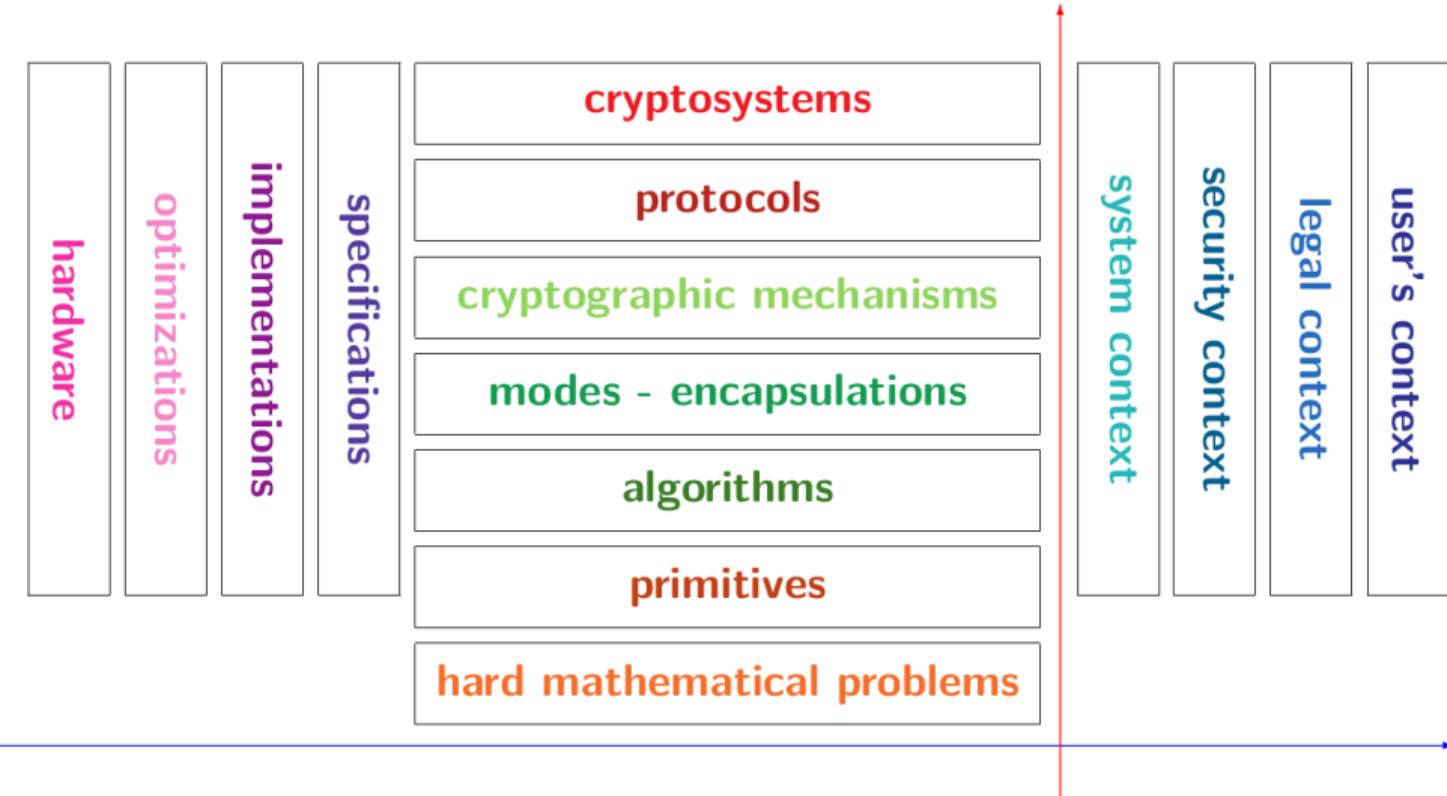

(45)

```

725 // PAPER LINES 38-39
726 rct::key alpha = rct::skGen();
727 rct::key ve = vector_exponent(aL, aR);
728 rct::key A;
729 rct::addKeys(A, ve, rct::scalarmultBase(alpha));
730
731 // PAPER LINES 40-42
732 rct::keyV sL = rct::skvGen(MN), sR = rct::skvGen(MN);
733 rct::key rho = rct::skGen();
734 ve = vector_exponent(sL, sR);
735 rct::key S;
736 rct::addKeys(S, ve, rct::scalarmultBase(rho));
737
738 // PAPER LINES 43-45
739 rct::key y = hash_cache_mash(hash_cache, A, S);
740 rct::key z = hash_cache = rct::hash_to_scalar(y);
741
742 // Polynomial construction by coefficients
743 const auto zMN = vector_dup(z, MN);
744 rct::keyV l0 = vector_subtract(aL, zMN);
745 const rct::keyV &l1 = sL;
746
747 // This computes the ugly sum/concatenation from PAPER LINE 65
748 rct::keyV zero_twos(MN);
749 const rct::keyV zpow = vector_powers(z, M+2);
750 for (size_t i = 0; i < MN; ++i)
751 {

```

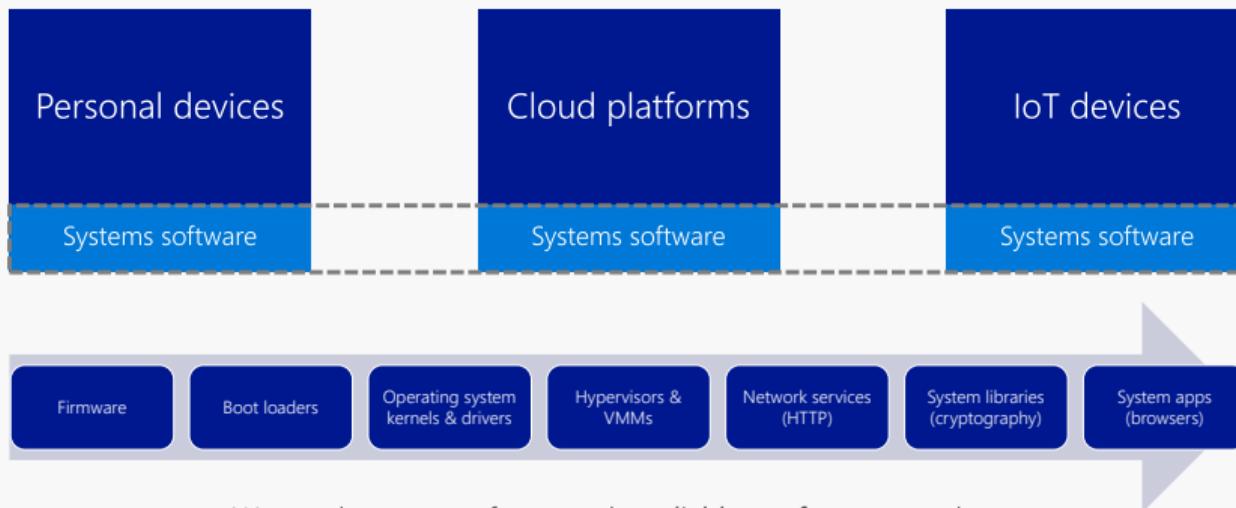

Cryptographic abstraction layers

System Software

The malleable foundation of modern technology

Systems software provides the core platforms on which other software is built

We need systems software to be reliable, performant, *and* secure

[Matt Miller, SSTIC 2020]

Small recall on ANSSI/CCN and ITSEF

ANSSI - French certification center

- Implements the certification scheme
- Licenses the ITSEFs (Information Technology Security Evaluation Facilities) which conduct the evaluations
 - Audit (preliminary and follow-up)
 - Follow-up of their technical skills through evaluations
 - Mandatory participation to technical challenges
- Supervises the evaluation projects

2022: CRY.ME challenge for all ITSEFs and only for cryptographic analysis

A challenge to test them all

- Cryptographic analysis compliant to ANSSI's procedures^{1,2}
- Test vehicle common to all ITSEFs (software and hardware) but not only
 - **Open-source software product**
- Cover vulnerabilities of different types and levels of difficulty
 - **Several types of vulnerabilities:** conformance, symmetric crypto, asymmetric crypto, random number generation, protocols, implementation
 - **Three levels of difficulty:** not necessarily the same difficulty for identification and exploitation
 - **Various sources of errors:** weak choice of algorithms, design and/or implementation errors, differences between specifications and implementation, etc.

Secure messaging explained to your child

Alice

Bob

Alice wants to talk only to Bob

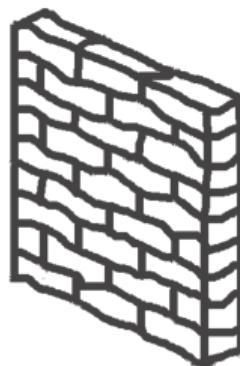

But they are separated

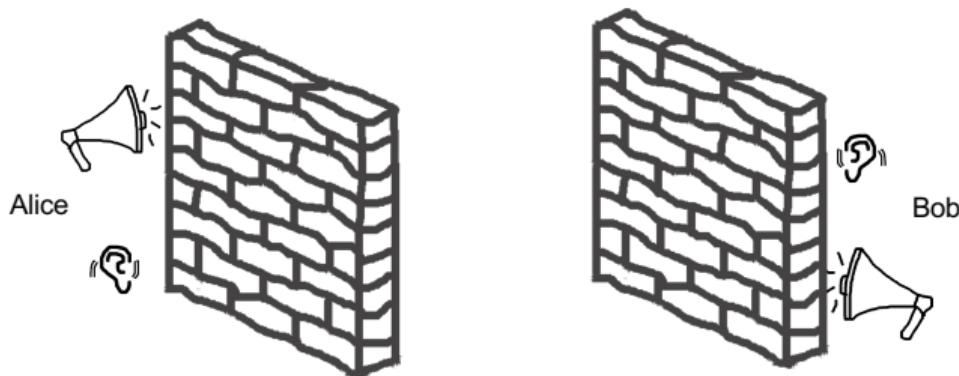

Alice

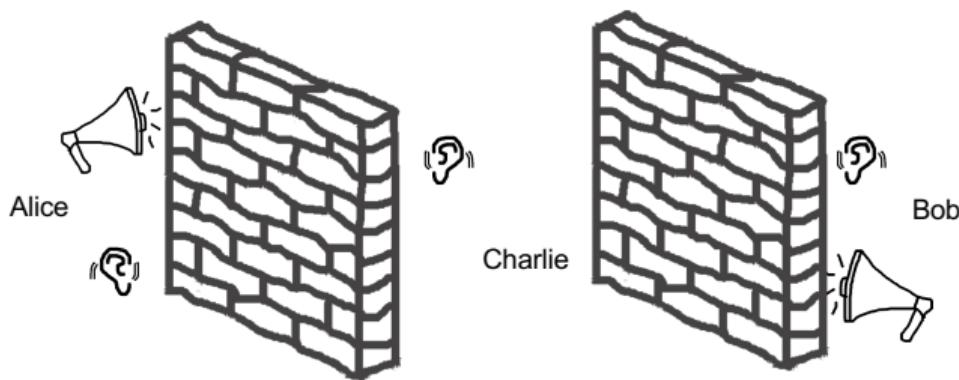

Bob

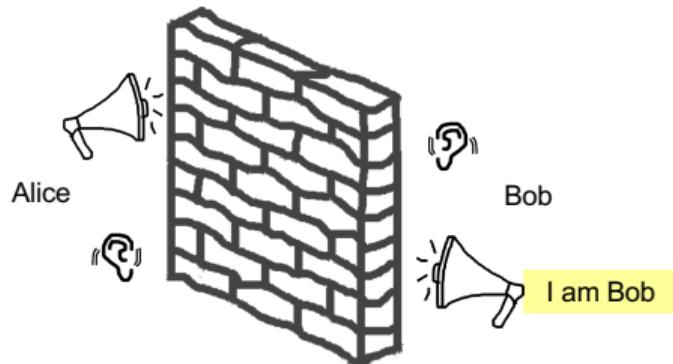

And they have to talk loud

Others can hear them

Or even pretend to be Bob

Alice's phone wants to talk to Bob's phone

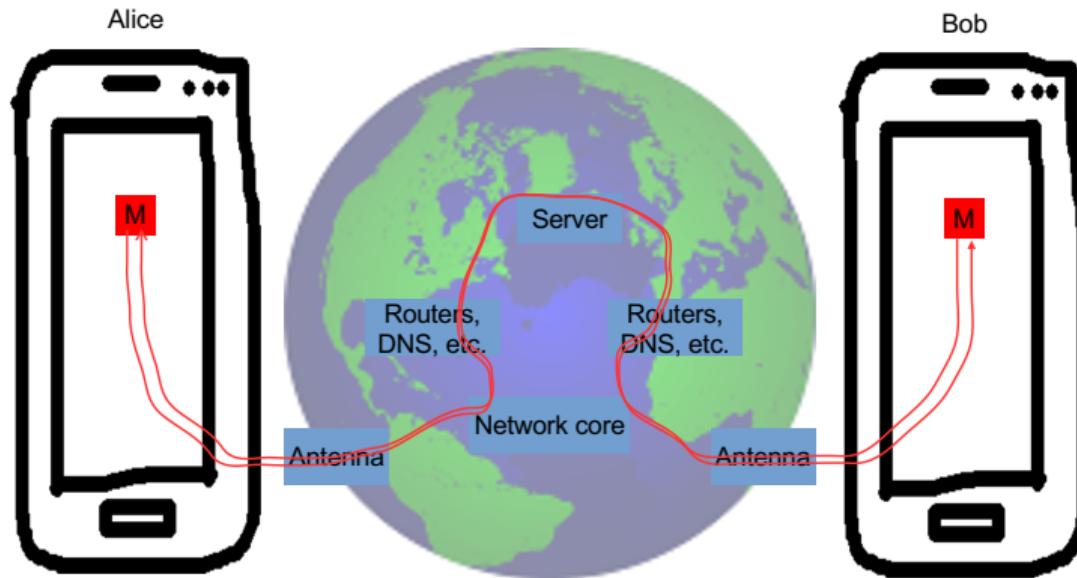

Through the vast Internet

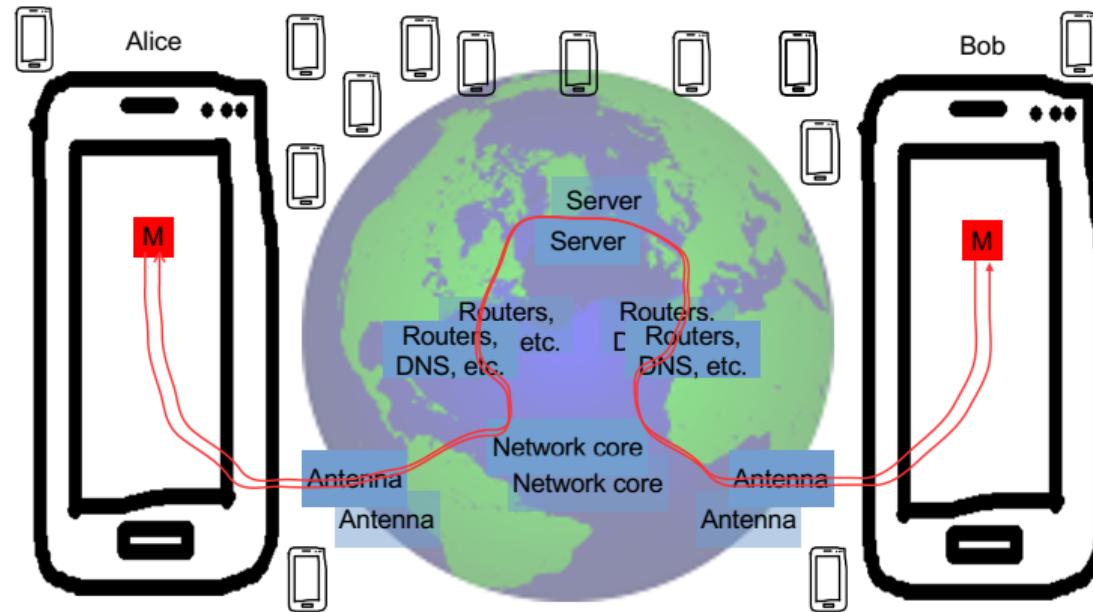

So it needs to talk loud...

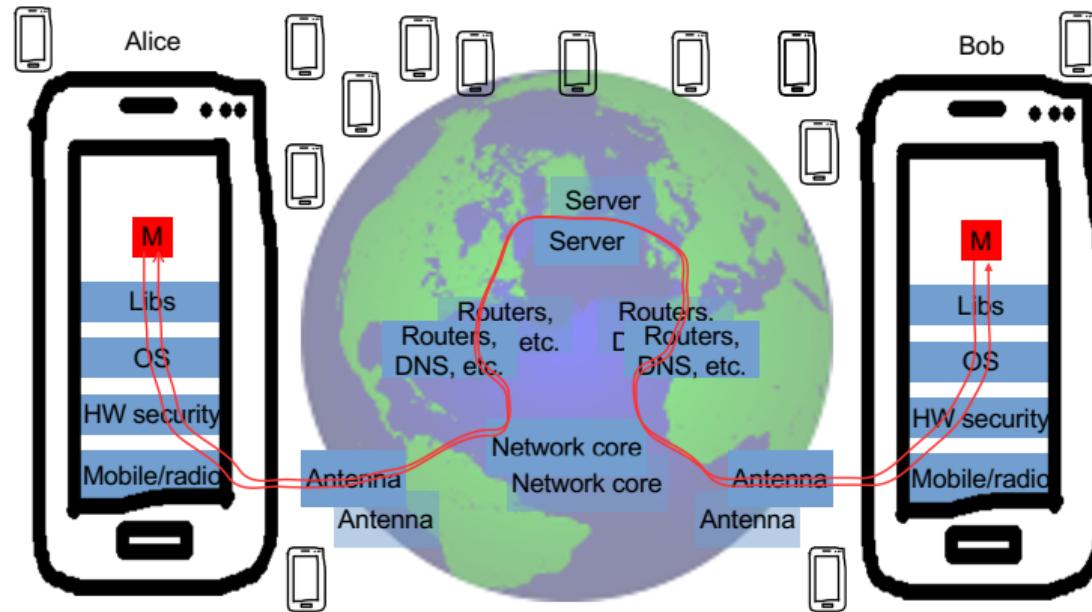

Very loud

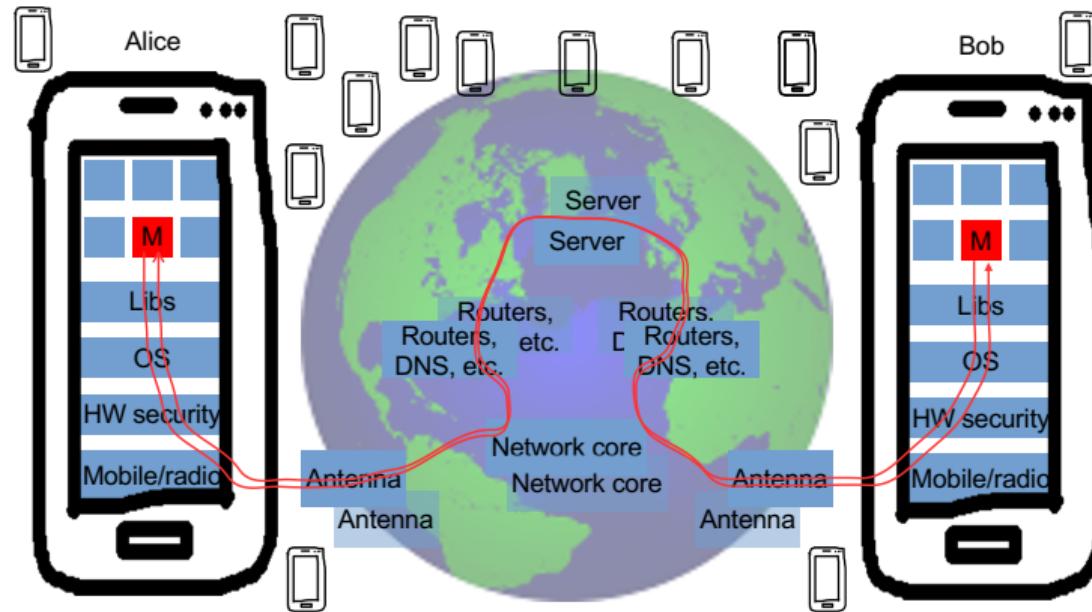

Others could hear them

What to trust?

You are not alone

You are not your phone

phone lost

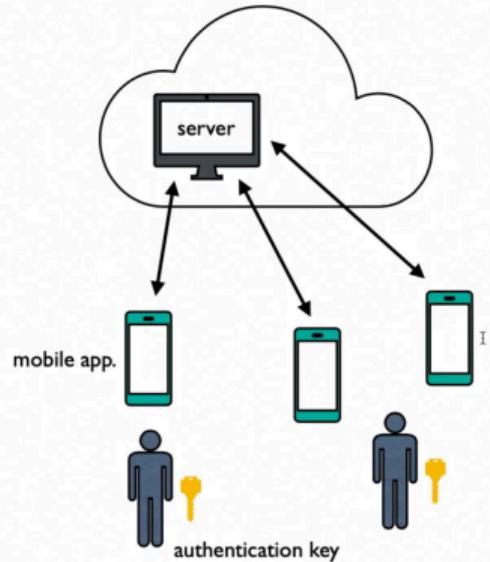

Who said it looks simple?

Features

https://en.wikipedia.org/wiki/Comparison_of_cross-platform_instant_messaging_clients

The example app: a modified matrix a.k.a CRY.ME

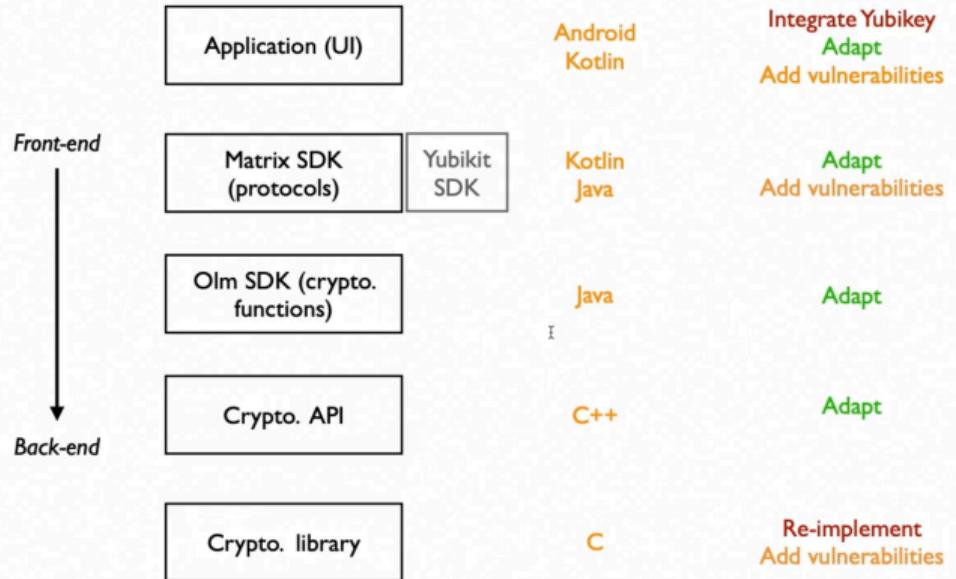

Functionalities

- Create account
- Login / Logout
- Send / Receive messages (1-to-1 or group)
- Send / Receive attachments
- Secure backup storage on the server
- Out-of-band verification between users

The example app: a modified matrix a.k.a CRY.ME

Architecture layers

Evaluation on Quarkslab's side

Big steps:

- ▶ Meetings
- ▶ Analysis of security and environment issues
- ▶ Analysis of product implementation
- ▶ Compliance and resistance — Compliance, resistance and vulnerability analysis
- ▶ Compliance and resistance — Cryptography analysis
- ▶ Exploitation of the results
- ▶ Synthesis and report redaction

Total duration: 30 person.days

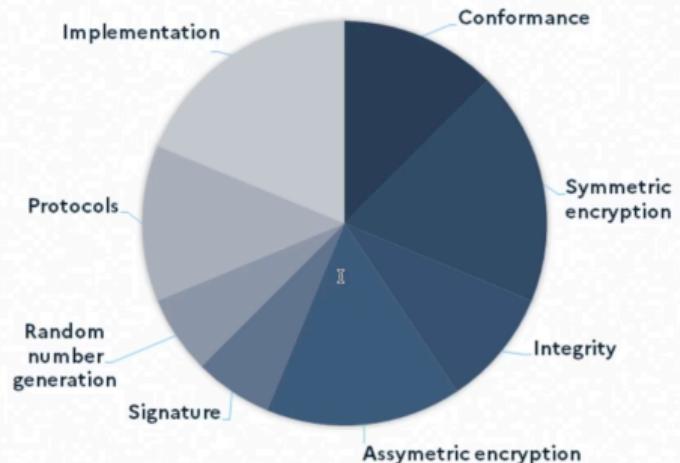

Evaluation on Quarkslab's side

Big steps:

- ▶ Meetings
- ▶ Analysis of security and environment issues
- ▶ Analysis of product implementation
- ▶ Compliance and resistance — Compliance, resistance and vulnerability analysis
- ▶ Compliance and resistance — Cryptography analysis
- ▶ Exploitation of the results
- ▶ Synthesis and report redaction

Total duration: 30 person.days of Angèle Bossuat and Philippe Teuwen with Matthieu Ramtine Tofighi Shirazi as head of CESTI

Vuln categories (no spoil)

Vuln categories (spoil)

3.2	Analysis of the vulnerabilities
3.2.1	Vulnerability #001 PBKDF2
3.2.2	Vulnerability #002 RSAKeyGen
3.2.3	Vulnerability #003 SHA-3
3.2.4	Vulnerability #004 DRBG
3.2.5	Vulnerability #005 WeiG
3.2.6	Vulnerability #006 HMAC-SHA-1
3.2.7	Vulnerability #007 PUK
3.2.8	Vulnerability #008 LCG
3.2.9	Vulnerability #009 Attachment
3.2.10	Vulnerability #010 TLS
3.2.11	Vulnerability #011 AES Padding Oracle
3.2.12	Vulnerability #012 Server RSA Certificate
3.2.13	Vulnerability #013 SHA-1
3.2.14	Vulnerability #014 RSA Memory Cleaning
3.2.15	Vulnerability #015 Ratchet Reset
3.2.16	Vulnerability #016 Key Reuse
3.2.17	Vulnerability #017 Not AES
3.2.18	Vulnerability #018 IVAES
3.2.19	Vulnerability #019 Wei25519 Key Generation Checks
3.2.20	Vulnerability #020 Bad Ratchet Generation
3.2.21	Vulnerability #021 Server Accreditation Protocol
3.2.22	Vulnerability #022 Random Generation OOM
3.2.23	Vulnerability #023 Megolm Message Replay
3.2.24	Vulnerability #024 AES GCM Tag Length
3.2.25	Vulnerability #025 Backup MAC
3.2.26	Vulnerability #026 Wei25519 Key Generation
3.2.27	Vulnerability #027 Password Policy

Vuln categories (spoil)

- ▶ Classical theoretical vulns and attacks: LCG, ECDRBG
- ▶ Implementation issues: unfortunate typos on AES and PBKDF2, padding oracle
- ▶ Not-on-purpose vulns: Message replay, random generation OOM, Yubikey default PUK and management key

Bridging the gap between paper and exploit

as fast as possible... On the importance of tools

- ▶ IDE for code review and navigation
- ▶ diffing different version of codes
- ▶ HTTP Toolkit for intercepting and manipulating HTTP(S) communications
- ▶ RsaCtfToolkit, Pananoid Crypto
- ▶ Faas, CADO-NFS

Conclusion

- ▶ "a mega crypto CTF"
- ▶ Challenges encourage learning by doing
- ▶ Team work for expertise coverage: learn how to speak sufficiently a different language
- ▶ CRY.ME is available in open-source as a pedagogical platform:
<https://github.com/ANSSI-FR/cry-me>
